

Gaming Laptops: Gamers Finally Take Their Game on The Road

If you ever see a PC gamer outside of his or her house, consider yourself lucky. All jokes aside, gaming laptops have only recently been able to keep up with some of today's modern games. The question is- are laptops ready for the gaming scene, or are manufacturers marketing to gamers for extra cash flow?

Laptops Get Gaming Upgrades

Gamers have a few choices when it comes to PC gaming. The latest advances in technology have enabled laptop manufacturers to pack more of a punch in a smaller area- meaning gamers can take their gaming on the road.

Processors are now sporting Duo-Core technology, which is a fancy phrase for the use of two processors. This allows for more processing to be done in a multitasking environment- meaning smaller clock rates on processors are needed, which in turn produces less heat. (And as laptop owners know, heat will destroy a laptop quicker than anything)

Next in line we have hard drives, which have seen less innovation in the laptop industry. Hard drives are still remaining in the 5,200 RPM areas, as compared to the 7,200 RPM that most desktop computers can enjoy. This means less performance, but because of heat and space issues, laptop owners usually just have to deal with this flaw in laptop gaming.

When it comes to the graphics card, gamers tend to splurge on the best video card available. But as gamers will soon find out, laptops have less options in this area. This is because laptops are smaller in design, and the latest graphics cards run too hot or are too bulky to fit in a laptop's design.

Pitfalls In Laptop Gaming

One of the biggest flaws that gamers will notice is battery life. PC gaming laptops will typically drain a laptop in just a couple of hours, depending on the performance and options. This is compared to normal laptops that can often get 10 hours of battery life without problem. PC gamers on laptops can carry a charger with them- but this will help heat up the laptop and require more cooling.

Laptop users are accustomed to the touchpad that comes with laptops, but trying to play games with them just doesn't cut it. There are mice for laptops, but this requires a flat surface- and mobile users will attest to the fact that a good flat surface can be hard to come by.

Closing Comments

Mobile gaming is becoming popular in today's culture, but the hardware and technology isn't always as advanced as we would like it to be. Be prepared to shell out a lot more money for gaming laptops. Also take into effect that excess heat can ruin the life of a laptop- meaning you should invest in cooling pads or extra fans for best effect.
