

Let's See How To Speed Up My Pc

It is extremely frustrating to have a slow computer. This is why I went around asking how to speed up my pc. And, here are the things I have found that have worked for me.

Use a defragmenter

When you store stuff on your hard drive, the computer just puts your files into the first open areas it finds. Even if the file does not fit, it breaks, or fragments, the file to part of it will fit in there. The problem here is when you go to launch the file, the computer must go and find all of the parts and put it back together. A defragmenter can help put these together on a regular basis.

Max out your computer memory

With the cost of computer memory being where it is today, you should put the most memory you can in your computer. If you are not sure how much it holds, just do a search online with your model number and it will tell you how much memory you can use. This will have an immediate impact in the speed of your pc.

I Run a registry repair software weekly

This is one of those areas most people do not really think about. Probably, because they have never even heard of the registry. And, if you have, you have no idea how to get there, which is a good thing because you can really mess things up in here. This is the area that tells the computer how to operate. It gives the programs specific instructions on how to do stuff. You can imagine if this area is messed up what would happen. The computer would be looking for stuff in the wrong places, which would cause it to be extremely slow. A registry repair tool can fix this.

The registry repair software will run a scan of your computer and let you know how many errors you have. Then, with the click of one button, you can fix all of them. Now, your computer will run fast again.

Just by doing these few things, you can see how I speed up my pc when I am having trouble.

About the Author

Using [registry repair software](#) is a guaranteed way to ensure your computer runs fast. And when used on a weekly basis, it [removes computer errors](#) and speeds up your pc.
